Can metformin lower HbA1c in obese youths with type 1 diabetes?
Metformin might help overweight and obese youths with type 1 diabetes (T1D) overcome pubertal insulin resistance and achieve better glycoemic control, researchers suggested in PLOS ONE, although their specific results appeared equivocal.
A nine-month regimen of daily metformin added to insulin therapy in this patient group resulted in clinically meaningful—but not statistically significant—reductions in hemoglobin A1c (HbA1c) and daily insulin requirements, reported lead investigator Benjamin Neovius, MD, and colleagues.
In addition, these studies did not use a standardized insulin treatment protocol to ensure uniform glycoemic control in the placebo and treatment groups, they noted.

NATIVE TEXT AD
The Anoxomat: The best anaerobic conditions for lab managers
The Advanced™ Anoxomat® System's new Ergonomic Jar is lightweight yet durable, stackable and easily fits inside incubators. Anoxomat is the smart choice for laboratories looking to improve workflow, increase productivity and savings. For more information, download the whitepaper ▶

HHS advances development of new monoclonal antibody drug for Ebola
A novel Ebola virus disease treatment based on three monoclonal antibodies will advance in development through an agreement between the U.S. Department of Health and Human Services' (HHS) Office of the Assistant Secretary for Preparedness and Response (ASPR) and Regeneron Pharmaceuticals, Inc., of Tarrytown, New York.
ASPR's Biomedical Advanced Research and Development Authority (BARDA) will provide up to a total of \$50 million over the next 23 months to support development as well as manufacturing of the experimental monoclonal antibody therapeutic drug for use in studies. These monoclonal antibodies bind to a key Ebola viral protein and neutralize the virus, decreasing the amount of virus in the body that the patient's immune system has to fight.
The Regeneron monoclonal antibody therapeutic candidate is BARDA's latest development project in the global response to the Ebola epidemic in West Africa. BARDA has worked with industry and federal interagency partners to develop multiple monoclonal antibody and small molecule therapeutic drugs, Ebola vaccine candidates to protect against the virus, and a rapid point-of-care diagnostic test for Ebola virus disease.
